Catalogue of Minerals

Cabinet B: metallic and vitreous specimens

B.1 *Galena* ..... Cumberland
Lead-grey cubes with three perfect cleavages; the fresh fracture is bright, but the exposed face has dulled. Specific gravity recorded as 7.48.

B.2 *Chalcopyrite* ..... Cornwall
Brass-yellow massive specimen with an iridescent tarnish. The streak is greenish black and should be observed on an unglazed tile.

B.3 *Hematite* ..... Elba
Botryoidal surface over a compact red-brown mass. The powdered streak distinguishes it from magnetite even where the exterior is nearly black.

B.4 *Fluorite* ..... Derbyshire
Pale violet interpenetrating cubes upon limestone. Four cleavage directions yield octahedral fragments under a light blow.

B.5 *Quartz* ..... St. Gotthard
A clear six-sided prism terminated by paired rhombohedra. Minute chlorite inclusions mark an earlier stage of growth.

Key to the entries

Roman type	observed description
Italic type	accepted specimen name
Small capitals	locality or collection
Old-style figures	measurements and catalogue numbers

Revised after inspection of the cabinet, 1906
