A Short Account

of the Air-Pump

with observations made in a closed receiver

When the receiver had been exhausted by repeated strokes of the piston, the enclosed bladder enlarged, although no hand was laid upon it. Upon admitting the outward air, it returned by degrees to its former compass. This alteration was entered in the journal before any cause was assigned.

The arrangement separates three effects that are often bundled together as "old book style": an ornament made from vector strokes, a boxed initial made from ordinary TeX, and a narrow text measure. Each can be removed without disturbing the other two.

Experiment performed in the winter quarter, 1672.
